

TASTE V2 Reference Card

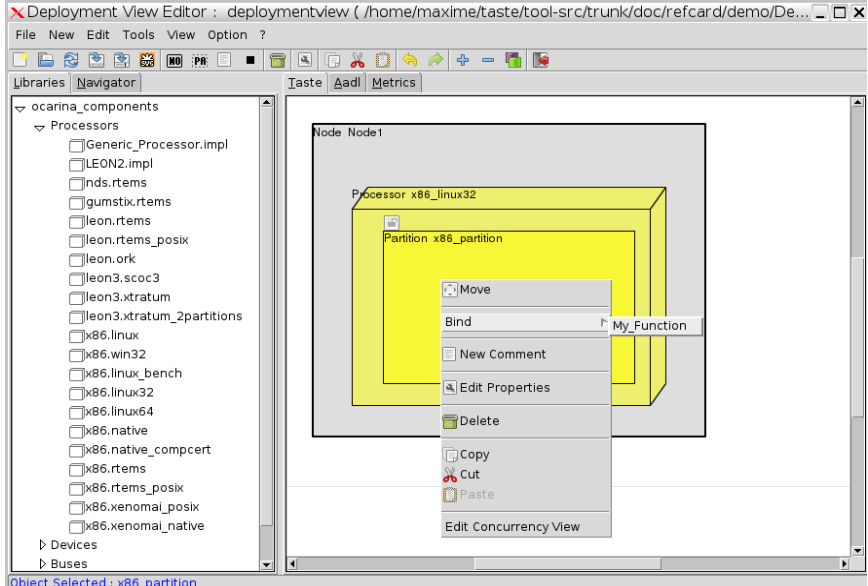

How to quickly build a system using TASTE
Version 1.4 (18/10/2013)

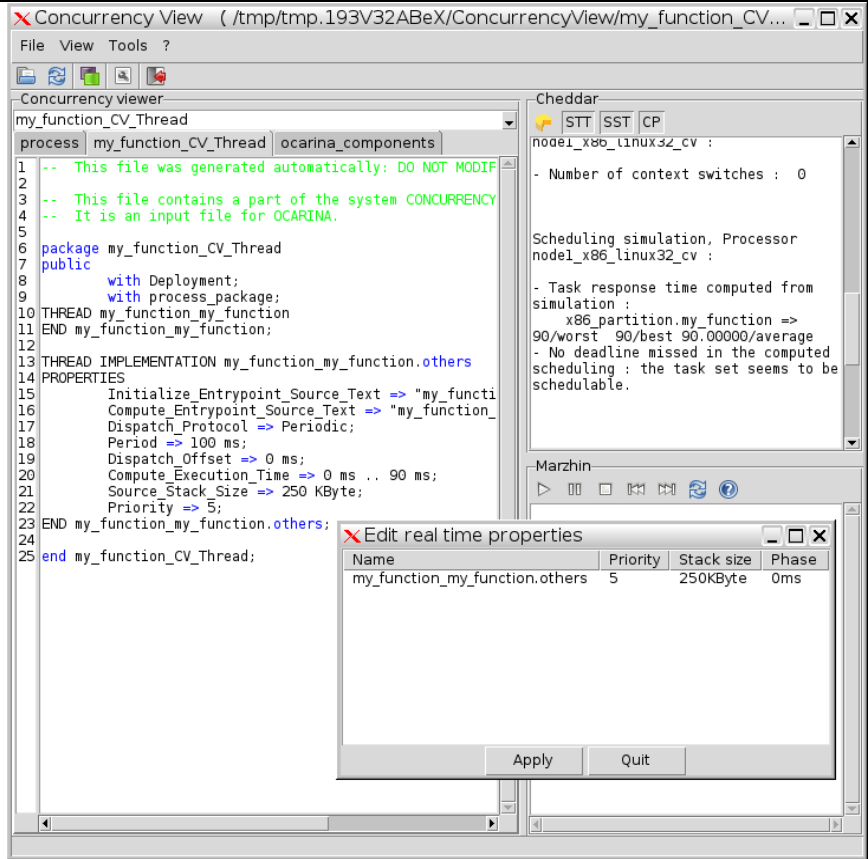

IMPORTANT - Always make sure you are using the latest version of the TASTE tools.
From within the TASTE Virtual machine, you can click on the Update-TASTE icon.
From a terminal, you can run the `Update-TASTE.sh` script, and close the terminal when it is done.

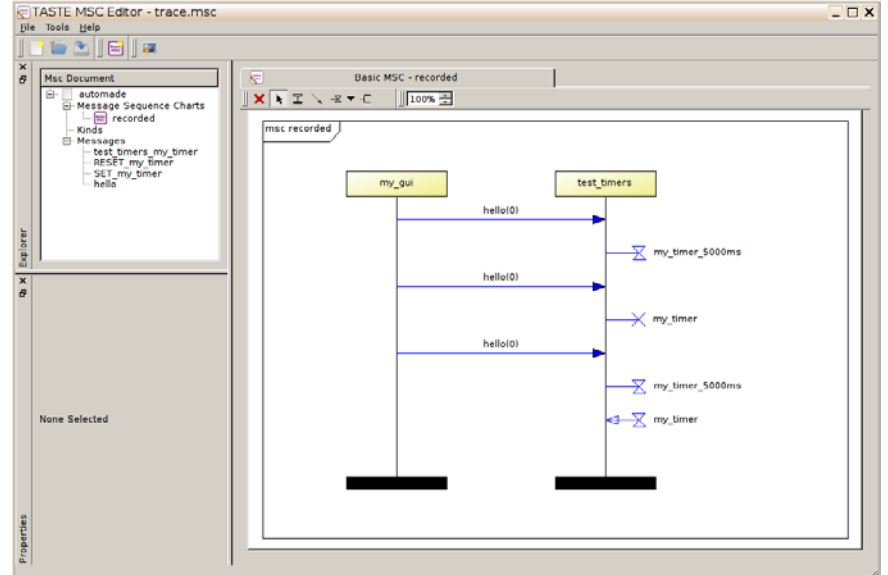

STEP-BY-STEP TUTORIAL

Step	Actions	Comments
Create a new project	<p>Create a new working directory and start the TASTE editor. Most of the work can be done from within this single tool.</p> <p>Run this command from a terminal to create your system:</p> <pre>\$ taste-create-interface-view</pre>	<p>Later on, you can re-open/edit your project by typing:</p> <pre>\$ taste-edit-interface-view</pre> <p>This editor will open:</p> 

Step	Actions	Comments
Add functions and containers	<p>In the editor, right-click to open the contextual menu</p> <p>Add functions and specify for each of them:</p> <ul style="list-style-type: none"> - Their name - Their interface (provided and required) - Their implementation language - Their description - Their context parameters (if any) <p>With the mouse, you can click on a required interface and connect it to the provided interface of another function.</p>	<p>Context parameters allow to specify:</p> <ul style="list-style-type: none"> - Typed static data (usable in the functional code) - Timers - Compilation flags - Context-dependent data that can be processed during the build, such as reference to some external initialization parameters, etc. <p>Provided interface can carry parameters. You can use the default data types (UInt32, Boolean, etc) or create your own types (see step below)</p>
Specify data types	<p>Select the menu item <i>File->Dataview->Edit Data View</i> to open the ASN.1 text editor.</p> <p>You can modify existing types or create your own.</p> <p>Save and close when you are done ; if no syntax error is found then the data types are reloaded in the model editor.</p>	 <pre> TASTE-Dataview DEFINITIONS ::= BEGIN IMPORTS T-Int32, T-UInt32, T-Int8, T-UInt8, T-Boolean FROM TASTE-BasicTypes; -- Numerical types must have a range MyReal ::= REAL (0.0 .. 1000.0) MyEnum ::= ENUMERATED { hello, world, howareyou } -- Use the SEQUENCE construct for data structures MySeq ::= SEQUENCE { a MyInteger, b ENUMERATED { taste(1), welcomes(2), you(3) } } -- Use the CHOICE construct when alternative types are used MyChoice ::= CHOICE { a BOOLEAN, b MySeq } -- Use bounds in SEQUENCE OF to define arrays MySeqOf ::= SEQUENCE (SIZE (2)) OF MyEnum MyOctStr ::= OCTET STRING (SIZE (3)) -- You can also declare variables (they will be visible in C, Ada and SDL) myVar MySeqOf ::= { hello, world } END </pre>

Step	Actions	Comments
<p>Edit the functional code or models</p>	<p>On the main diagram, right-click on a function to open the contextual menu.</p> <p>Depending on the implementation language you chose for the function, select the relevant editor (“Edit Ada code”, ”Open SDL editor”, etc.)</p> <p>If you want to work with your own external tools (e.g. Simulink or RTDS) you have to generate the code skeletons first using the menu option <i>Tools->Generate code skeletons</i>.</p>	<p>For C and Ada a text editor is opened (Kate).</p> <p>For SDL the OpenGEODE tool allows to create graphical state machines and generate code.</p> <p>For all supported languages a model (or code) skeleton is automatically generated, ensuring consistency of the interfaces in the complete system.</p>
<p>Create deployment view</p>	<p>On the main diagram, right-click and select the option to <i>Edit Deployment View</i></p> <p>The deployment view allows to map the software functions on hardware components, and add buses and drivers in case of a distributed system.</p>	<p>On the left side of the editor, you can select processor boards, busses, and drivers. Drag and drop what you need to the diagram.</p> <p>On the <i>partition</i>, right click and select the functions you want to bind to the chosen processor.</p> <p>The name of a partition is the name of the target application that will be generated.</p> 

Step	Actions	Comments								
(Optional) Tune the real-time attributes of your system	<p>From the deployment view editor, you may select the <i>Tools->Edit Concurrency view</i> option in the menu.</p> <p>This editor allows you to view the threads that will be created for your system and edit some properties for fine tuning of the application:</p> <ul style="list-style-type: none">- Thread priority- Stack size per thread- Phase (or offset) <p>You can also run the Cheddar and the Marzhin analysis tools that are built-in, to check scheduling analysis of your system.</p> <p>For these functions to work you must have specified the worst case execution time of each provided interface of your system.</p> <p>Close the Concurrency View and Deployment View editors to go back to the main tool editor (Interface View editor).</p>	 <p>The screenshot displays the 'Concurrency View' editor. The main window shows a code editor with the following content:</p> <pre> 1 -- This file was generated automatically: DO NOT MODIFY 2 3 -- This file contains a part of the system CONCURRENCY 4 -- It is an input file for OCARINA. 5 6 package my_function_CV_Thread 7 public 8 with Deployment; 9 with process_package; 10 THREAD my_function_my_function 11 END my_function_my_function; 12 13 THREAD IMPLEMENTATION my_function_my_function.others 14 PROPERTIES 15 Initialize_Entrypoint_Source_Text => "my_functi 16 Compute_Entrypoint_Source_Text => "my_function_ 17 Dispatch_Protocol => Periodic; 18 Period => 100 ms; 19 Dispatch_Offset => 0 ms; 20 Compute_Execution_Time => 0 ms .. 90 ms; 21 Source_Stack_Size => 250 kByte; 22 Priority => 5; 23 END my_function_my_function.others; 24 25 end my_function_CV_Thread;</pre> <p>On the right, the 'Cheddar' window shows simulation results for 'node1_x86_linux32_cv':</p> <ul style="list-style-type: none">- Number of context switches : 0Scheduling simulation, Processor node1_x86_linux32_cv :- Task response time computed from simulation :x86_partition.my_function => 90/worst 90/best 90.00000/average- No deadline missed in the computed scheduling : the task set seems to be schedulable. <p>Below the Cheddar window, the 'Marzhin' window shows real-time properties for the thread 'my_function_my_function.others':</p> <table><tr><th>Name</th><th>Priority</th><th>Stack size</th><th>Phase</th></tr><tr><td>my_function_my_function.others</td><td>5</td><td>250kByte</td><td>0ms</td></tr></table> <p>The Marzhin window also has 'Apply' and 'Quit' buttons.</p>	Name	Priority	Stack size	Phase	my_function_my_function.others	5	250kByte	0ms
Name	Priority	Stack size	Phase							
my_function_my_function.others	5	250kByte	0ms							
Build the system	<p>From the Interface View editor, you can build your system from the <i>Tools->Build the system</i> option. Two runtime systems are proposed (C or Ada).</p> <p>Another window will show you the build progress and report errors if any.</p>	<p>Between two builds you may want to use the option <i>Tools->Cleanup output (binary) directory</i>. It can happen that files from a previous build pollute the next build in some situation. If you do not cleanup, a subsequent build will be done much faster as only the modified data will be recompiled.</p>								

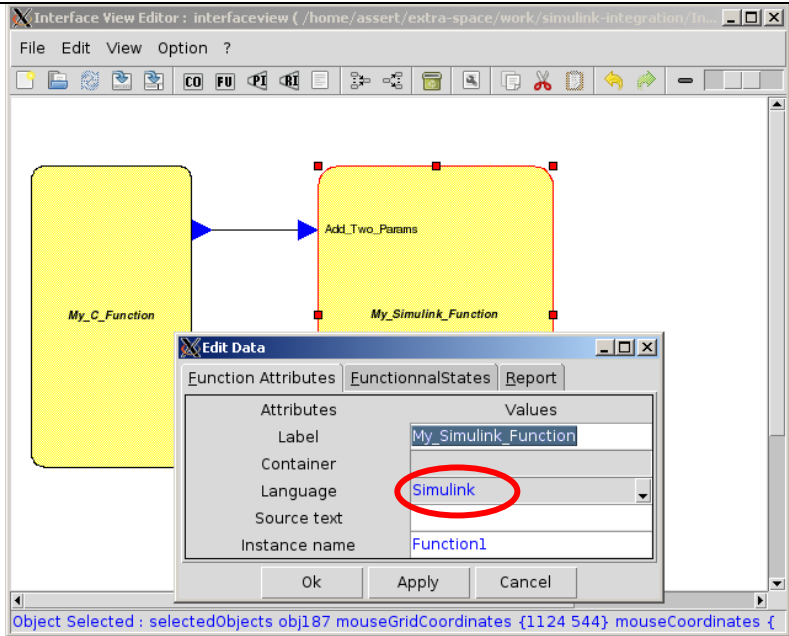

Step	Actions	Comments
Run the system and interact with it	<p>When the build is done, you can quit the editor and explore the directory where the generated application was created.</p> <pre>\$ cd binary.c/binaries</pre> <p>If your system contains GUI components, a binary per GUI is placed in that same directory.</p> <p>You can either run your applications directly (on the chosen platform) or activate tracing function:</p> <pre>\$ taste-run-and-trace ./my_demo</pre> <p>At the end of the execution (stop it with Ctrl-C) a file trace.msc will appear. Open it with the MSC editor:</p> <pre>\$ msce.py -o trace.msc</pre>	<p>The tracing tool records all the internal communication between your functions, as well as the timers.</p> 

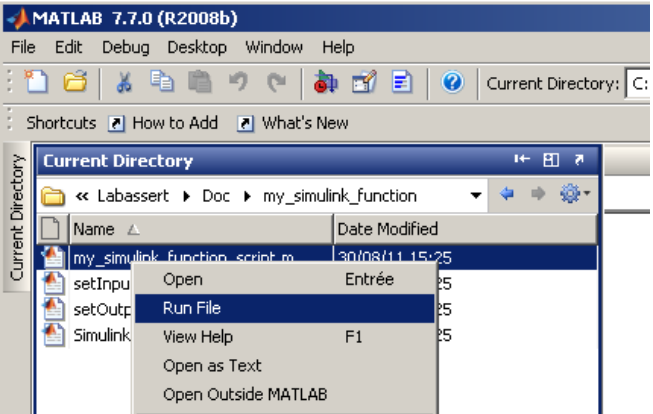

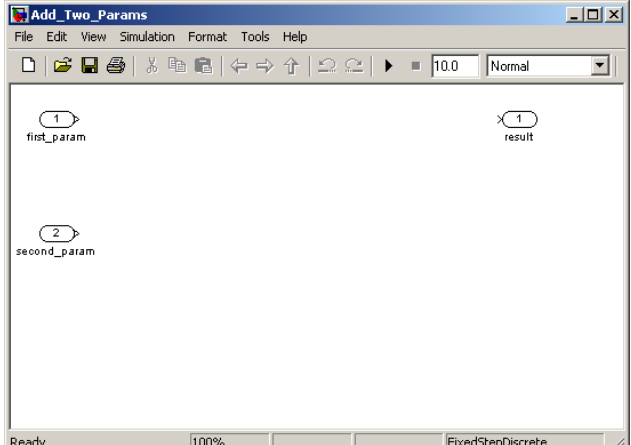

FOR MORE INFORMATION – Check the TASTE wiki here: <http://taste.tuxfamily.org>

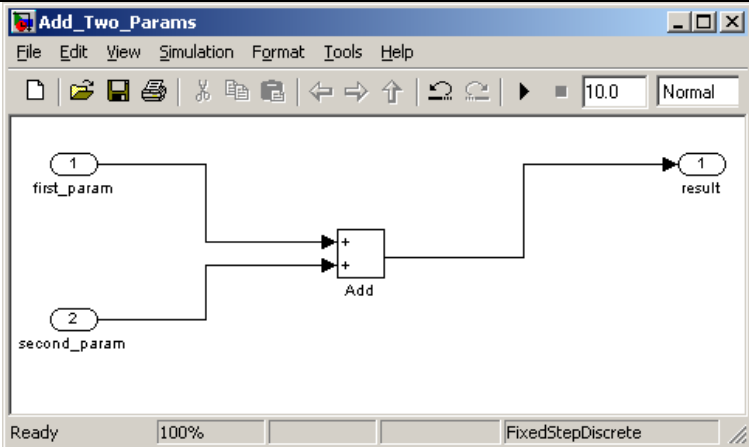

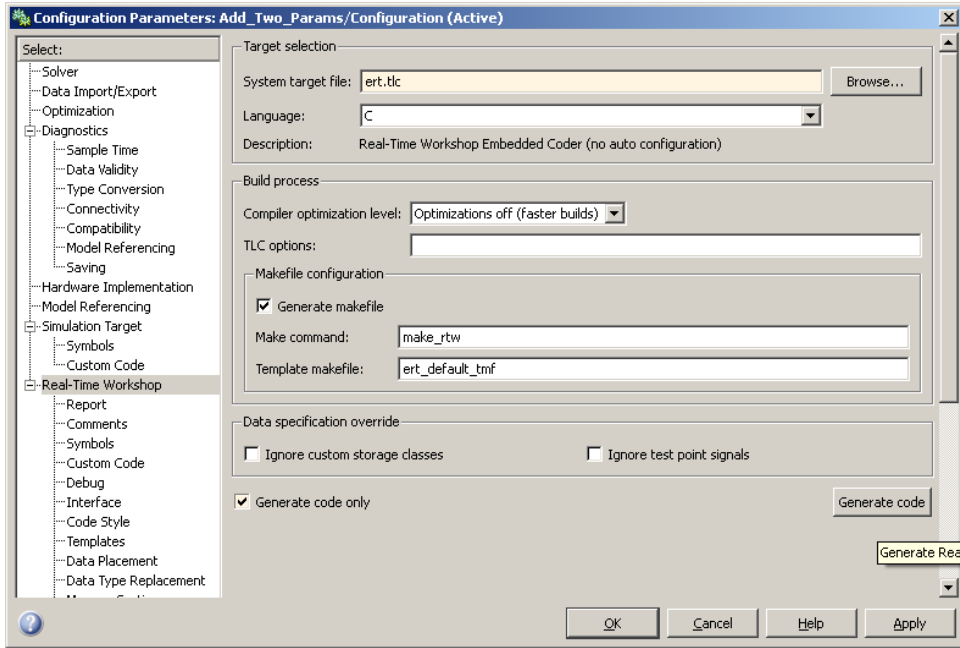

You will learn more about the SDL editor, the use of timers, the use of Python scripts to test your system, and the use of SQL databases in combination with your ASN.1 data model.

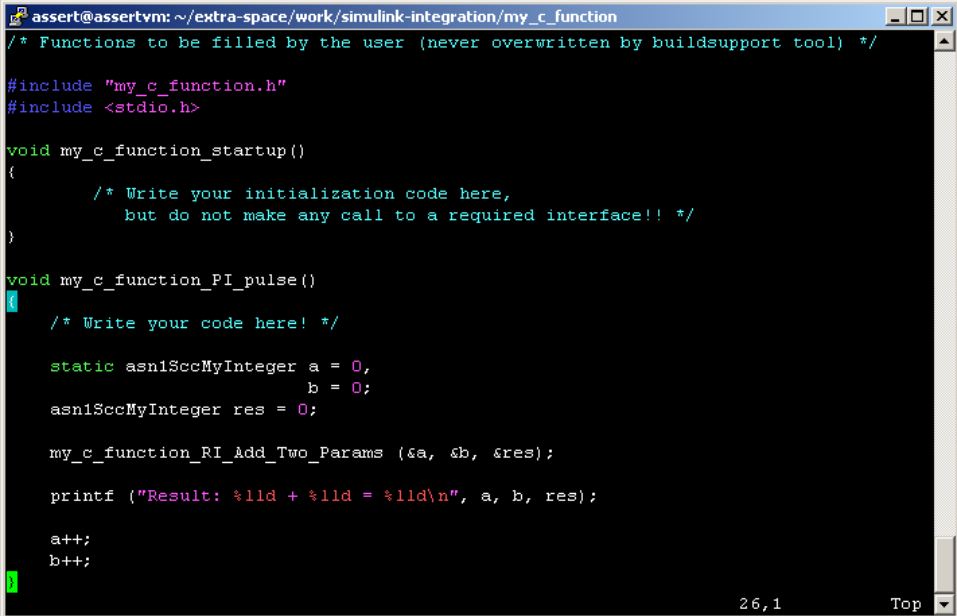

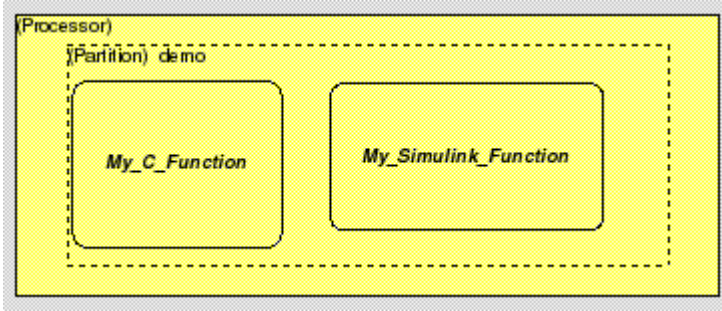

TASTE V2 Quick Reference Card

Integration of a Simulink block as part of a TASTE system

Action	Illustration	Notes																
Create an interface view to capture the Simulink function	 <table data-bbox="544 919 1460 1224"><tr><th>Name</th><th>Type</th><th>Encoding Protocol</th><th>Direction</th></tr><tr><td>first_param</td><td>MyInteger</td><td>NATIVE</td><td>in</td></tr><tr><td>second_param</td><td>MyInteger</td><td>NATIVE</td><td>in</td></tr><tr><td>result</td><td>MyInteger</td><td>NATIVE</td><td>out</td></tr></table>	Name	Type	Encoding Protocol	Direction	first_param	MyInteger	NATIVE	in	second_param	MyInteger	NATIVE	in	result	MyInteger	NATIVE	out	<p>The <i>Simulink</i> block must have only ONE provided interface and NO required interface.</p> <p>The provided interface can contain any number of INPUT and OUTPUT parameters using the ASN.1 types.</p> <p>The provided interface must be set either as PROTECTED or UNPROTECTED.</p>
Name	Type	Encoding Protocol	Direction															
first_param	MyInteger	NATIVE	in															
second_param	MyInteger	NATIVE	in															
result	MyInteger	NATIVE	out															
Generate the function skeleton	Right-click on the diagram and select the option <i>Generate code skeletons</i> .	A new directory is create with the following files: <pre>my_simulink_function/ -- Simulink_DataView_asn.m -- my_simulink_function_script.m -- setInputsBusCreator.m `-- setOutputsBusSelector.m</pre>																
Start Matlab and run	Inside Matlab right-click on	This script calls the other ones.																

Action	Illustration	Notes
<p>the script generated by TASTE</p>	<p>“my_simulink_function_script.m” and choose <i>Run File</i>:</p> 	<p>The Matlab workspace will be updated with new data types and busses, that result from the ASN.1 to Matlab type conversion.</p> <p>After a short while a new file will appear next to the Matlab scripts: Add_Two_Params.mdl (this is the name of the interface we gave as an example).</p>
<p>Open the mdl-generated file</p>	<p>Double-click on Add_Two_Params.mdl to open the Simulink editor:</p> 	<p>What you see is the skeleton of the function you specified in the TASTE interface view.</p>

Action	Illustration	Notes																
Fill the function by connecting the input and the output of the block. You can use blocks from the Simulink library.																		
Generate the code from the Simulink model	<p>Usually this is straightforward. Go to the menu <i>Tools->Real-Time Workshop->Options</i> then tick the <i>Generate code only</i> option and click on <i>Generate code</i>.</p> 	<p>This might take a while, you can follow the progress on the main Matlab console.</p> <p>When it is done, the following file appears in your working directory: <i>Add_Two_Params.zip</i></p> <table border="1" data-bbox="1507 805 1933 1007"><tr><td>Simulink_DataView_asn.m</td><td>30/08/11 15:25</td></tr><tr><td>setOutputsBusSelector.m</td><td>30/08/11 15:25</td></tr><tr><td>setInputsBusCreator.m</td><td>30/08/11 15:25</td></tr><tr><td>my_simulink_function_script.m</td><td>30/08/11 15:25</td></tr><tr><td>Add_Two_Params.zip</td><td>30/08/11 15:37</td></tr><tr><td>Add_Two_Params.mdl</td><td>30/08/11 15:39</td></tr><tr><td>slprj</td><td>30/08/11 15:36</td></tr><tr><td>Add_Two_Params_ert_rtw</td><td>30/08/11 15:37</td></tr></table>	Simulink_DataView_asn.m	30/08/11 15:25	setOutputsBusSelector.m	30/08/11 15:25	setInputsBusCreator.m	30/08/11 15:25	my_simulink_function_script.m	30/08/11 15:25	Add_Two_Params.zip	30/08/11 15:37	Add_Two_Params.mdl	30/08/11 15:39	slprj	30/08/11 15:36	Add_Two_Params_ert_rtw	30/08/11 15:37
Simulink_DataView_asn.m	30/08/11 15:25																	
setOutputsBusSelector.m	30/08/11 15:25																	
setInputsBusCreator.m	30/08/11 15:25																	
my_simulink_function_script.m	30/08/11 15:25																	
Add_Two_Params.zip	30/08/11 15:37																	
Add_Two_Params.mdl	30/08/11 15:39																	
slprj	30/08/11 15:36																	
Add_Two_Params_ert_rtw	30/08/11 15:37																	
Copy and unpack the generated code back to TASTE working folder	<p>If Matlab was not installed in your TASTE Virtual machine and you had to copy the .m scripts to a different machine, copy back the generated zipfile to your TASTE working folder and unzip it.</p> <pre>cd my_simulink_function unzip Add_Two_Params.zip</pre>	<p>A <i>lot</i> of files will appear. The reason is that Simulink copied in the zipfile ALL files required to make an independent compilation of the project (which is what TASTE needs).</p>																

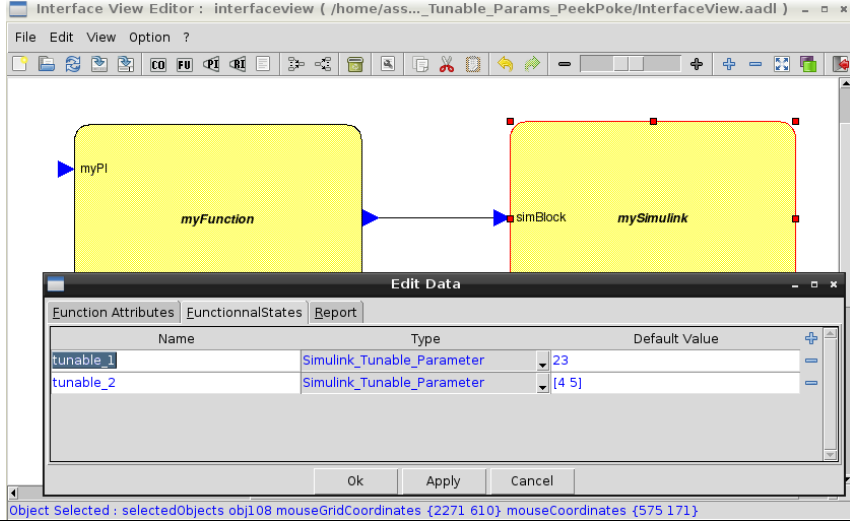

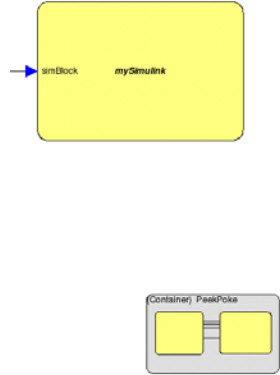

Action	Illustration	Notes
<p>Call the Simulink block from another TASTE function</p>	<p>As an example you can add a periodic interface to a function you may call “My_C_Function” (implemented in C)</p> <p>Calling the Simulink block is like invoking any other required interface. The call is synchronous, which means you get the result “immediately”.</p>  <pre> assert@assertvm: ~/extra-space/work/simulink-integration/my_c_function /* Functions to be filled by the user (never overwritten by buildsupport tool) */ #include "my_c_function.h" #include <stdio.h> void my_c_function_startup() { /* Write your initialization code here, but do not make any call to a required interface!! */ } void my_c_function_PI_pulse() { /* Write your code here! */ static asn1SccMyInteger a = 0, b = 0; asn1SccMyInteger res = 0; my_c_function_RI_Add_Two_Params (&a, &b, &res); printf ("Result: %lld + %lld = %lld\n", a, b, res); a++; b++; </pre>	
<p>Build the system and run it</p>	<p>Create a deployment view – do not forget to put both functions in the SAME partition (synchronous functions cannot reside in a physically different computer)</p>  <p>Then run <code>./build-script.sh</code></p>	

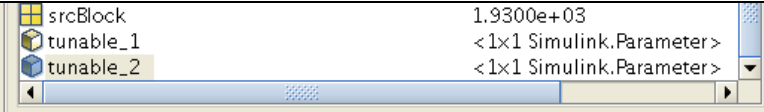

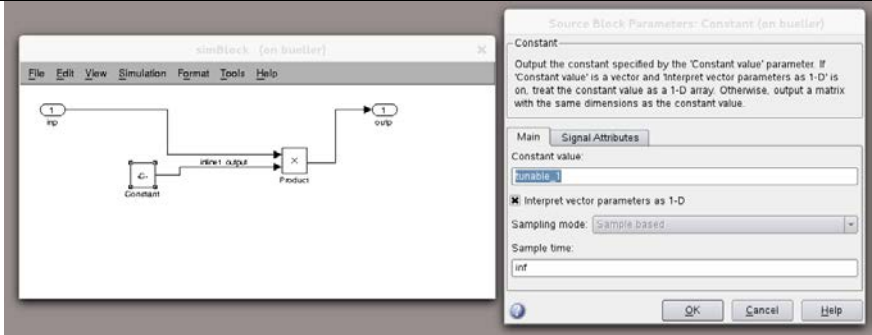

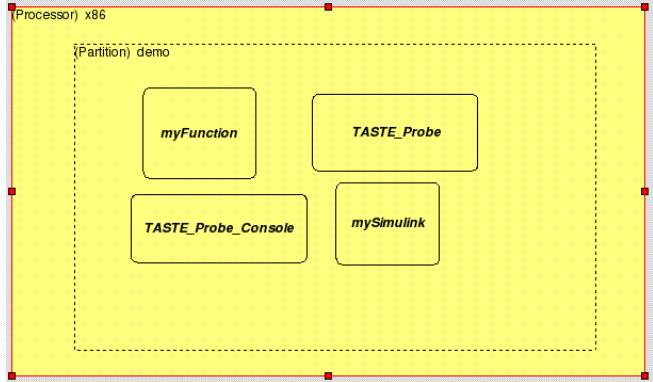

TASTE V2 Quick Reference Card

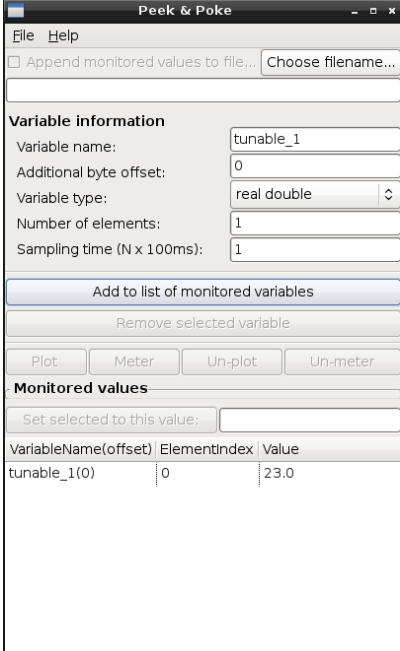

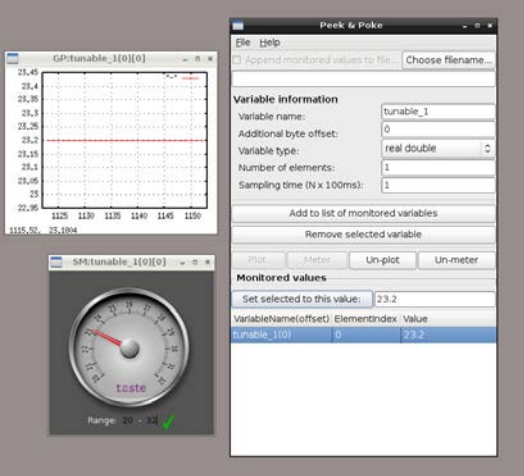

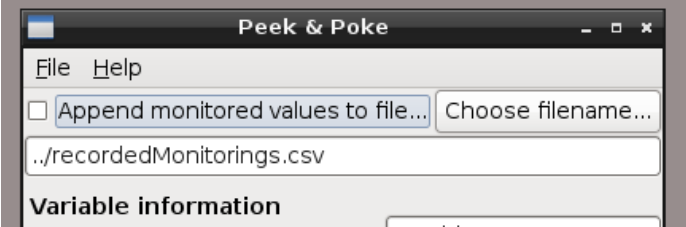

Using Simulink *Tunable Parameters* and TASTE *PeekPoke* functionality

Checkout demo in [~/tool-src/testSuites/Regression_AADLv2/Demo_Tunable_Params_PeekPoke](#)

This tutorial explains how to import the special PeekPoke component to a TASTE system. The PeekPoke component allows to monitor and change parameters of any function of the system without having to add dedicated interfaces. It can be used to tune algorithms or to check the evolution of any global variable of the system at runtime (it can plot and record data).

Action	Illustration	Notes
<p>Create a system that contains a Simulink block, and click on the “Functional States” tab in the Simulink function block</p> <p>Enter variable names, choose “Simulink_Tunable_Parameter” type, and set a value.</p> <p>Click on OK when you are done.</p>		<p>Values have to be numerical (integer or real). They can be multi-dimensional as shown in the screenshot.</p>
<p>Right click and select “Import”.</p> <p>Choose file “export_PeekPoke.aadl” in directory /home/assert/tool-inst/share/peekpoke/component and click on Open</p> <p>You can save and close the interface view editor.</p>		<p>A small container with two functions will appear in the lower right hand corner of the interface view.</p>
Generate function skeletons	taste-generate-skeletons	Result:

Action	Illustration	Notes
		<pre>mysimulink/ -- Simulink_DataView_asn.m -- mysimulink_script.m -- setInputsBusCreator.m -- setOutputsBusSelector.m -- tunable_parameters.m</pre>
Open Simulink and run the main script: <code>mysimulink_script.m</code>		The two tunable parameters appear in the Matlab workspace.
Fill up the Simulink skeleton <i>and make use of the tunable parameters</i> (otherwise the code generator will skip them)		Use tunable parameters wherever you need at runtime to monitor and patch data (e.g. to tune an algorithm).
Generate the code from the Simulink model and unzip the resulting file back in the folder where TASTE generated the .m scripts.		
Create a deployment view and map your functions on hardware.		The TASTE_Probe component must be placed on the same node as the function containing the parameters you want to monitor, while the TASTE_Probe_Console component must reside on a native platform (Linux).
Build the system	From the interface view editor, run the menu option: <i>Tools->Build the system</i> (in C or in Ada)	
Run the main system binary	<pre>\$ cd binary.c/binaries \$./demo</pre>	
Open a new terminal and run the PeekPoke GUI	<pre>\$ cd PeekPoke \$./peekpoke.py ../demo</pre>	A GUI shall appear

Action	Illustration	Notes
<p>In the GUI, start typing the variable name you want to monitor. The complete name shall appear.</p> <p>Select the variable type (real double)</p> <p>Select the number of elements (1)</p> <p>Select the sampling time (1)</p> <p>Click on: Add to list of monitored variables</p>		<p>The tunable parameter value will appear immediately in the bottom table.</p> <p>If the Simulink model execution modifies the value, it will be reflected at the next sample time.</p> <p>You can monitor all the binary's global variables (not only Simulink tunable parameters). Just start typing a variable name and add it to the list.</p>
<p>Select a value, and click on one of the options (Plot, Meter, Un-plot, Un-meter, Set selected to this value)</p>		<p>Use this feature to patch data at runtime (possibly on target) and see how your system reacts (inject faults, tune algorithms...).</p>
<p>Record monitored values: click on Choose filename and select a (.csv) text file.</p> <p>Tick/untick the “Append monitored values to file” checkbox.</p>		<p>The resulting csv file can be open in a spreadsheet for post-processing.</p>

<i>Action</i>	<i>Illustration</i>	<i>Notes</i>
	<pre>\$ cat recordedMonitorings.csv "Timestamp(EPOCH)";"Variable name";"Variable value" 1323958767,76;"tunable_1[0]";23,2 1323958767,86;"tunable_1[0]";23,2 1323958767,86;"tunable_1[0]";23,2 1323958767,96;"tunable_1[0]";23,2 1323958768,06;"tunable_1[0]";23,2</pre>	
<p>You can save the graphical layout. When you reload it, all plots/meters will appear at the same place and monitored variable values will automatically be updated again.</p> <p>File -> Save As</p> <p>Then File -> Open</p>		

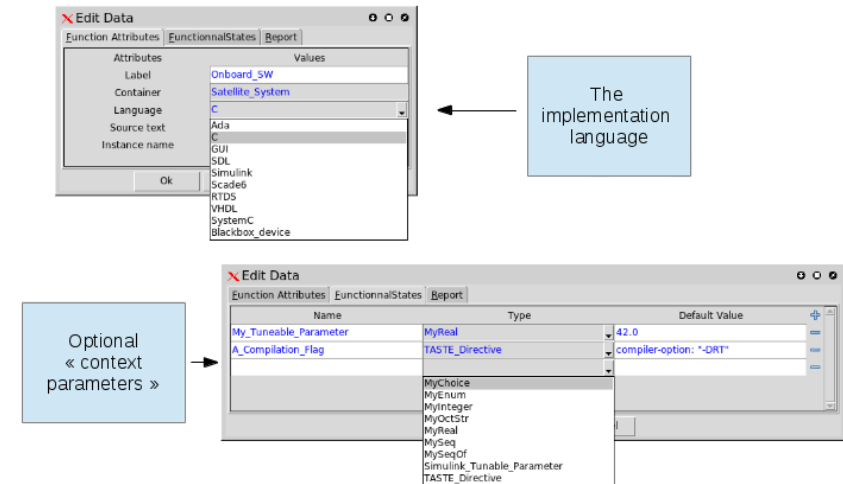

TASTE V2 Quick Reference Card

Function semantics (from the TASTE Training slides)

Function

- A function is a terminal level entity. It has a behaviour that can be triggered through a set of **provided interfaces**.
- All interfaces of a function have visibility and control access on the function's internal data (static data).
- With one exception, the interfaces of a function are mutually exclusive, and run to completion (it is not possible to execute concurrently two interfaces of a function, as they share state data).

Properties of a function

Context Parameters

- The « Functional State » tab offers a space for flexibility :
 - **Context parameters** allow defining constants at model level and make them accessible from user code
 - Support for C, Ada and Simulink (instructs code generator to generate « tuneable parameters », which are global variables)
 - Value can be generated from an external source
 - **TASTE directives** are used to fine-tune the build process with additional properties (e.g. compilation or link flags that are specific to a piece of code)
 - Used to integrate Simulink code when it requires special defines (-DRT, -DUSE_RTMODEL)
 - When a property proves usefulness, it gains a dedicated entry in the GUI

Provided and required interfaces

- A provided interface (PI) is a service offered by a function. It can be
 - **Periodic**, in which case it does not take any parameter, and is used to handle cyclic tasks
 - **Sporadic** (or **asynchronous**) and optionally carry a parameter. The actual execution time is decided by the real-time scheduler (call is *deferred*)
 - **Synchronous**, with or without **protection** and optionally carry parameters (in and out)
 - The protection is a semaphore (in C) or a protected object (in Ada) preventing concurrent execution of several interfaces of the same function.
 - Use unprotected interface to implement e.g. « getter » functions
 - Caller blocks on execution (call is *immediate*) – Just like a direct function call.
 - At runtime, synchronous functions execute in the caller's thread space.

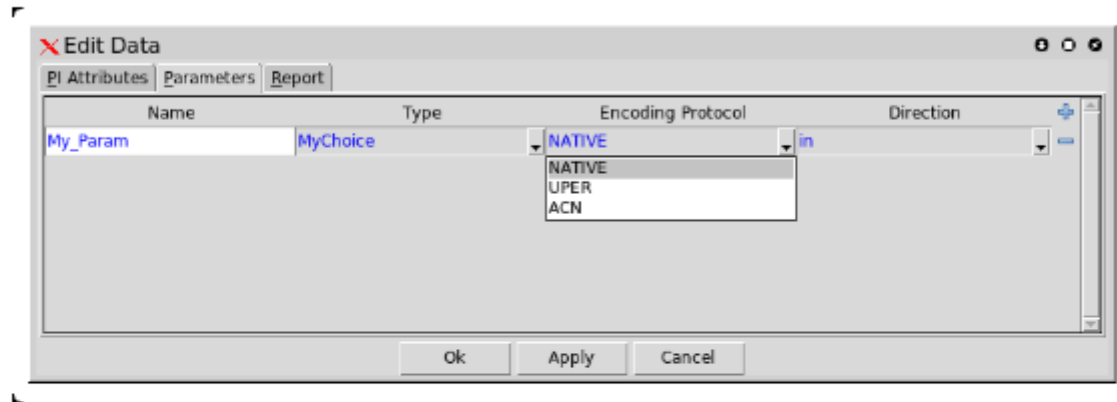

TASTE V2 Quick Reference Card

ASN.1 (1)

ASN.1 is used to describe the data type of function parameters

Function parameters

Each parameter has a type (from the ASN.1 model), a **direction** (in or out), and an **encoding protocol** :

Native : means memory dump – no special treatment

UPER : compact binary encoding

ACN : user-defined encoding

TASTE V2 Quick Reference Card

ASN.1 (2)

ASN.1 – basic types

INTEGER

→ `My-int ::= INTEGER (0..7)`
value `My-int` ::= 5

REAL

→ `My-real ::= REAL (10.0 .. 42.0)`

BOOLEAN

ENUMERATED

→ `My-enum ::= ENUMERATED { hello, world }`

OCTET STRING

→ `My-string ::= OCTET STRING (SIZE (0..255))`
value `My-string` ::= 'DEADBEEF'H

BIT STRING

→ `My-bitstring ::= BIT STRING (SIZE (10..12))`
value `My-bitstring` ::= '00111000110'B

ASN.1 – complex types

• SEQUENCE

→ `My-seq ::= SEQUENCE {`
 `x My-int,`
 `y My-enum OPTIONAL`
 `}`
value `My-seq` ::= { x 5 }

• CHOICE

→ `My-choice ::= CHOICE {`
 `choiceA My-real,`
 `choiceB My-bitstring`
 `}`
value `My-choice` ::= choiceA : 42.0

• SEQUENCE OF

→ `My-seq ::= SEQUENCE (SIZE (0..5)) OF BOOLEAN`
value `My-seq` ::= { 1, 2, 3 }

• SET / SET OF

TASTE V2 Quick Reference Card

ACN

ACN allows to specify legacy encodings – It can be used to describe the format of PUS packets, leaving only the “interesting part” (payload data) in the ASN.1 model

Check the documentation in </home/assert/tool-src/doc/acn>

```
MySeq ::= SEQUENCE {  
    alpha    INTEGER,  
    gamma    REAL OPTIONAL  
}
```

```
MySeq[] {  
    alpha [],  
    beta  BOOLEAN [],  
    gamma [present-when beta, encoding IEEE754-1985-64]  
}
```

ASTE V2 Quick Reference Card

SDL - OpenGEODE

SDL is language that can be used to model state machines, and generate code. TASTE support a commercial tool (RTDS), and has its own built-in editor (opengeode) for simpler functions.

Check the training material for description of all symbol. Additional information on www.opengeode.net
